Issue No. 2

Question of the week!

Overview of the heart

The heart is a unique piece of mechanical, electrical, chemical engineering that works in partnership with our brain and all of the other organs in our body to keep us alive!

Here are two You Tube videos that might help you understand the important job that your heart carries out every second of your life:

<https://www.youtube.com/watch?v=oHMmtqKgs50>

<https://www.youtube.com/watch?v=CWFyxn0qDEU>

It only takes one of these systems to get damaged or begin to fail to have an effect on the rest of your heart and your body.

For example: If you have coronary artery disease it sticks to the linings of your arteries that supply the oxygenated blood to your heart muscle. Then the blood cannot squeeze through the narrowing to get to the muscle. As a result the heart muscle cannot pump as well with less oxygen. This can lead to symptoms such as shortness of breath, light-headedness, or chest pain; all warning signs that your heart might be struggling to work as well as it should be.

It is so important that you do all that is in your control to keep your heart healthy or able to repair.

This can be hard but you are not alone. Let us know where you need help & advice, or if you have specific questions about your heart.

Nutrition Tidbits

Eat a variety of heart healthy foods each day to support your immune system

Always have a supply of:

- Frozen/fresh vegetables & fruit
- Canned/fresh/frozen fish
- Skinless poultry & lean meat
- Dried/canned beans & lentils
- Whole grain breads, cereal, & pasta
- Skim/1%MF milk/yogurt/cottage cheese/unsweetened soy/nut milks
- Olive/canola/avocado/oil/nuts/nut butters/avocado

CARDIOLOGIST CORNER

PLEASE REMEMBER THE IMPORTANCE OF STAYING ON YOUR HEART MEDICATIONS:

1. Heart disease is common in COVID-19 patients. High blood pressure is the most common risk factor in patients hospitalized with COVID-19.
2. There is no evidence that common heart medications such as ACEi (Ramipril, Perindopril, others), ARBs (Candesartan, Losartan, others) and low dose Aspirin increase the risk of COVID-19.
3. The Canadian Cardiovascular Society has recommended patients remain on their heart medications UNLESS specifically advised against it by their physician.

Do you have specific needs from your Cardiac Rehab team?
